

## HP Quality Center™ plug-in for BRIDGE:test and ATM Developer

The Quality Center plug-in for BRIDGE:test and ATM Developer is a module that allows users to seamlessly interface to HP Quality Center (formerly Mercury Interactive Quality Center) product as part of a wider corporate testing strategy.

Quality Center is used by a number of Level Four's customers to provide an enterprise view of their testing requirements, test plans and results, as well as providing high-level automation tools for initiating testing routines. Through using the Quality Center plug-in from Level Four, customers are now able to bring their ATM application testing under the same enterprise testing umbrella of Quality Center as part of a wider corporate test strategy.

ATM application testing in a Windows environment is a relatively new challenge facing banks. Previously, under the OS/2 operating system, testing of the ATM was limited due to the static nature of the operating system and the ATM application running on it. Although ATMs run Windows as the operating system, the complex hardware environment of the terminals has meant that testing strategies have evolved totally separately to mainstream corporate testing methodologies using a consistent approach across the enterprise. Increasingly there is a desire to apply this enterprise wide testing approach to testing ATM applications, but until now there has been no way of interfacing the enterprise wide Quality Center application, with an application such as BRIDGE:test or ATM Developer, which has the detailed ATM knowledge required to successfully automate testing of ATM software.

The Quality Center plug-in uses the Open Test Architecture (OTA) API within Quality Center which allows an interface to third party products. The interface allows users to execute tests within the BRIDGE:test/ATM Developer Regression Test Manager (RTM) environment and automatically upload the test results to the Quality Center test database.

### Features

- Seamless interface between Quality Center and BRIDGE:test
- Log in to Quality Center through BRIDGE:test
- Test ID matching between applications
- Store RTM results automatically in Quality Center database
- Results stored as MHTML/XML

### Benefits

- Integration of applications to include ATM application testing as part of wider corporate test strategy
- Streamline overall testing process
- Map test case repositories between BRIDGE:test and Quality Center
- Familiar interface to non-ATM specialist staff
- Easier auditability

The Quality Center plug-in from Level Four can be installed and configured simply, with no additional hardware required.
